

Tune-Up Information TRX-9450

1. Test Setup

This test setup calibrates the power of the 2 integrated radios and makes a basic communication test. The Ports RX3 to RX5 need not to be calibrated in power, because these are receive only ports. The whole test setup is controlled by a PC, which runs proprietary calibration software provided by the chip supplier. The following parameters are calibrated and tested in this setup:

- Output Power Level
- Spectrum Mask Test at maximum output power
- Link Test between DUT and Access Point

2. Test Procedure
